

Data Management Technologies

Unit 5 – Consolidation Task 1

As part of this consolidate task you will record the answers to the following questions into a word document:

- **Define a JSON object to represent the Make, Model and Year of a car using the appropriate JSON syntax**

A JSON object is a collection of key-value pairs defined within brackets in JSON notation. The keys are strings, while the values can be various data types, including numbers, strings or booleans.

```
{  
  "make": "Toyota",  
  "model": "Camry",  
  "year": 2019  
  "condition": "good"  
}
```

- **Give one advantage of using JSON notation in a noSQL database compared to storing the same information in a relational database management system**

JSON notation offer more flexibility in the creation of data fields. While the relational model is based on tables, rows, and columns, JSON notation utilises collections, documents and fields.

Within the JSON collections, related documents can contain the fields that are relevant to them and exclude those that are not. In a relational database, the non-relevant fields would have been present but perhaps had the value 'null'. JSON notation avoids this, helping to reduce clutter.

- **In respect of JSON, list the permissible types that a JSON value can take on**
 - String
 - Integer

- Float
- Boolean
- Null
- Array
- Object
